

# Tracking solar energy use

An online dashboard by local solar energy retailer Sun Electric allows consumers to monitor energy use in real time. The firm's SolarRoof programme, in partnership with JTC, allows the direct export of solar energy from JTC building rooftops to the national power grid.

A Google Maps image shows which specific rooftop the electricity comes from.

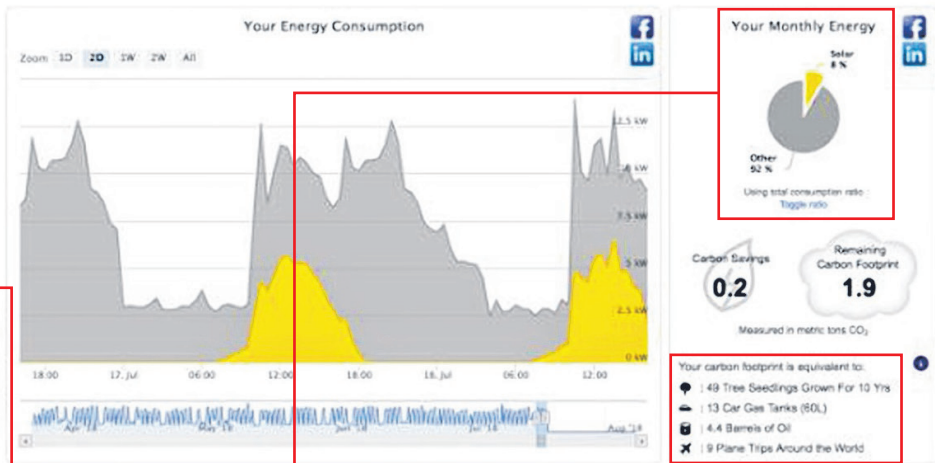

Chart allows users to see the percentage of solar energy allocated to their accounts.

Carbon footprint is measured in terms of, for example, plane trips around the world.
